

Warehouse And Inventory Management

ABC Analysis – a technique that categorizes inventory into three classes (A, B, C) based on consumption value. Related terms: inventory classification, Pareto principle. Example: Class A items represent 20% of SKUs but 80% of sales value. Practical application: prioritizes control and monitoring resources on high-value items. Challenge: requires accurate sales data and periodic review to reflect demand shifts.

Activity-Based Costing (ABC) – a costing method that assigns overhead costs to products based on the activities required to produce them. Related terms: cost drivers, overhead allocation. Example: Warehouse handling costs are traced to each SKU based on pick frequency. Practical application: improves pricing decisions and cost transparency. Challenge: data-intensive and may need specialized software.

After-Hours Receiving – receiving shipments outside normal business hours to reduce congestion. Related terms: extended receiving, off-peak operations. Example: A retailer schedules inbound trucks at 10 p.m. to free dock space for daytime outbound loading. Practical application: balances dock utilization and labor costs. Challenge: higher labor rates and security considerations.

Alarm System – a security mechanism that detects unauthorized entry or environmental hazards. Related terms: intrusion detection, fire alarm. Example: Motion sensors trigger alerts when a warehouse door is opened after hours. Practical application: protects high-value inventory. Challenge: false alarms can disrupt operations and increase costs.

Automation – the use of technology such as conveyors, robotics, and software to perform tasks with minimal human intervention. Related terms: mechanization, warehouse execution system. Example: Automated storage and retrieval systems (AS/RS) move pallets to picking stations. Practical application: boosts throughput and reduces labor errors. Challenge: high capital investment and maintenance complexity.

Backorder – a customer order that cannot be fulfilled immediately due to insufficient stock. Related terms: stockout, order fill rate. Example: A retailer places a backorder for a seasonal product awaiting replenishment. Practical application: communicates realistic delivery dates to customers. Challenge: may erode customer satisfaction if lead times are long.

Batch Picking – a picking method where a single picker collects items for multiple orders in one pass. Related terms: wave picking, zone picking. Example: A picker gathers ten orders of the same SKU from one location. Practical application: reduces travel time and improves labor efficiency. Challenge: requires careful order consolidation to avoid mixing items.

Barcoding – the use of machine-readable codes to identify items, locations, or transactions. Related terms: RFID, SKU. Example: Scanning a barcode updates inventory balance instantly. Practical application: enhances accuracy and speeds data capture. Challenge: damaged labels or scanner errors can disrupt the process.

Base Stock Level – the minimum quantity of an item that should be on hand to meet demand during the replenishment lead time. Related terms: safety stock, reorder point. Example: A base stock of 200 units covers average demand plus a buffer. Practical application: simplifies reorder calculations. Challenge: miscalculating lead time variability leads to excess or shortage.

Bill of Materials (BOM) – a hierarchical list of components, sub-assemblies, and raw materials needed to produce a finished product. Related terms: product structure, engineering change order. Example: A BOM for a laptop includes CPU, RAM, battery, and chassis. Practical application: drives demand for component inventory. Challenge: frequent product revisions require BOM updates.

Bin Location – a specific storage space identified by a unique code within a warehouse. Related terms: slotting, warehouse map. Example: Bin A-12-04 holds 50 units of SKU 12345. Practical application: enables precise item retrieval and inventory tracking. Challenge: inefficient slotting can increase travel distance.

Black-Box Forecasting – a predictive method where the underlying algorithm is not disclosed to the user. Related terms: machine learning, demand planning. Example: A cloud-based forecasting tool predicts sales without revealing its model. Practical application: provides quick forecasts for complex patterns. Challenge: lack of transparency makes it hard to validate or adjust.

Block Stacking – the practice of stacking pallets or cartons in a uniform, rectangular formation to maximize space. Related terms: cube utilization, pallet configuration. Example: Four pallets are stacked two high in a block. Practical application: optimizes floor space in high-density warehouses. Challenge: may increase handling time and risk of damage.

Break-Bulk Shipping – transporting cargo that is not containerized, often requiring individual handling. Related terms: LCL, FCL. Example: Heavy machinery shipped as break-bulk requires crane loading. Practical application: accommodates oversized or irregular goods. Challenge: higher handling costs and longer dwell times.

Buffer Stock – inventory held as a safeguard against demand spikes or supply disruptions. Related terms: safety stock, contingency inventory. Example: A retailer keeps an extra 10% of seasonal items as buffer stock. Practical application: protects service levels during volatility. Challenge: ties up capital and may become obsolete.

Capacity Planning – the process of determining the amount of space, labor, and equipment required to meet forecasted demand. Related terms: throughput, resource allocation. Example: Forecasted growth leads to a decision to add a 10,000 sq ft storage area. Practical application: ensures the warehouse can scale. Challenge: inaccurate forecasts can result in over- or under-investment.

Cross-Docking – a logistics practice where inbound shipments are directly transferred to outbound carriers with minimal storage. Related terms: transshipment, hub-and-spoke. Example: A distribution center receives pallets from a supplier and immediately loads them onto trucks for retail stores. Practical application: reduces inventory holding costs and speeds delivery. Challenge: requires precise timing and coordinated transportation.

Cubic Meter (CBM) – a volume measurement used to calculate space occupied by cargo. Related terms: dimensional weight, load factor. Example: A 2 m × 1.5 m × 1 m pallet occupies 3 CBM. Practical application: informs freight cost calculations. Challenge: mis-measurement can lead to under- or over-charging.

Cycle Counting – a periodic inventory audit method that counts a subset of items on a rotating schedule rather than a full physical inventory. Related terms: perpetual inventory, audit. Example: High-value items are counted monthly, low-value items quarterly. Practical application: maintains inventory accuracy with minimal disruption. Challenge: requires disciplined scheduling and data reconciliation.

Damaged Goods – items that have been compromised through breakage, spoilage, or mishandling. Related terms: return processing, quality control. Example: A pallet of glass bottles arrives with 5 % broken. Practical application: triggers inspection and disposition procedures. Challenge: increases waste and may affect customer perception.

Dead Stock – inventory that has not moved for an extended period and is unlikely to be sold. Related terms: obsolete inventory, slow-moving stock. Example: A fashion retailer holds 200 units of a past-season sweater. Practical application: prompts markdowns or liquidation. Challenge: ties up capital and storage space.

Decoupling Point – the stage in the supply chain where inventory is held to separate upstream production from downstream demand. Related terms: push-pull strategy, safety stock. Example: Finished goods stored at a regional warehouse act as a decoupling point. Practical application: buffers demand variability. Challenge: determining optimal location and size.

Delivery Performance – a metric that measures the ability to meet promised delivery dates and quantities. Related terms: on-time delivery, fill rate. Example: A 95 % delivery performance indicates most orders arrive as scheduled. Practical application: monitors service level agreements. Challenge: external factors such as traffic can affect performance.

Demand Forecasting – the process of estimating future product demand using historical data, market analysis, and statistical models. Related terms: sales projection, forecasting accuracy. Example: A retailer uses a moving average to forecast next month's sales. Practical application: drives inventory planning and procurement. Challenge: demand volatility and promotional effects can reduce accuracy.

Dock Scheduling – the coordination of inbound and outbound truck arrivals to optimize dock usage. Related terms: appointment system, yard management. Example: A warehouse assigns specific time slots to carriers to avoid bottlenecks. Practical application: improves dock throughput and reduces waiting time. Challenge: carrier delays can disrupt the schedule.

Drop-Ship – a fulfillment method where the supplier ships directly to the end customer, bypassing the retailer's warehouse. Related terms: third-party logistics, direct fulfillment. Example: An online store lists a product that a manufacturer ships straight to the buyer. Practical application: reduces inventory holding costs. Challenge: limited control over packaging and delivery experience.

Dual-Entry System – an inventory accounting method where each transaction is recorded as both a debit and a credit to maintain balance. Related terms: perpetual inventory, reconciliation. Example: Receiving 100

units adds a debit to inventory and a credit to accounts payable. Practical application: ensures financial integrity. Challenge: requires rigorous data entry discipline.

Economic Order Quantity (EOQ) – a formula that determines the optimal order size to minimize total holding and ordering costs. Related terms: inventory cost, reorder point. Example: EOQ calculation suggests ordering 500 units each cycle. Practical application: standardizes replenishment quantities. Challenge: assumes constant demand and lead time, which may not hold true.

Efficient Consumer Response (ECR) – a collaborative strategy among manufacturers, distributors, and retailers to improve supply chain efficiency. Related terms: CPFR, demand-driven replenishment. Example: Retailers share point-of-sale data with suppliers for faster replenishment. Practical application: reduces stockouts and inventory levels. Challenge: requires data sharing agreements and trust.

Emergency Replenishment – a rapid restocking process activated when inventory falls below critical levels unexpectedly. Related terms: safety stock, expedited shipping. Example: A sudden surge in demand triggers an emergency order with overnight delivery. Practical application: prevents stockouts during spikes. Challenge: higher transportation costs and limited supplier capacity.

FIFO (First-In, First-Out) – an inventory rotation method where the oldest stock is issued before newer stock. Related terms: LIFO, inventory turnover. Example: Perishable goods are picked from the front of the shelf to ensure older items leave first. Practical application: reduces spoilage risk. Challenge: requires accurate location tracking and proper picking discipline.

Fixed-Location Storage – a system where each SKU is assigned a permanent storage spot. Related terms: random storage, slotting. Example: SKU 56789 is always stored in bin B-03-12. Practical application: simplifies picking and inventory counts. Challenge: may lead to inefficient space utilization for low-velocity items.

Freight Consolidation – the practice of combining multiple shipments into a single container or truckload to achieve economies of scale. Related terms: LCL, pooling. Example: Three suppliers' pallets are consolidated into one 40-ft container. Practical application: lowers per-unit shipping costs. Challenge: requires coordination and may increase dwell time.

Freight Forwarder – an intermediary that arranges transportation, customs clearance, and related services on behalf of shippers. Related terms: NVOCC, customs broker. Example: A freight forwarder books ocean carriage and handles documentation for an exporter. Practical application: simplifies complex logistics. Challenge: reliance on third-party performance and fee transparency.

Gross Margin Return on Investment (GMROI) – a profitability metric that compares gross margin earned to the average inventory investment. Related terms: inventory turnover, ROI. Example: GMROI of 1.5 indicates \$1.50 gross profit for every \$1 invested in inventory. Practical application: assesses the financial efficiency of stocked items. Challenge: requires accurate cost and margin data.

Ground Handling – the set of services performed at an airport or seaport to move cargo between transport modes. Related terms: stevedoring, cargo handling. Example: Ground handling includes loading containers

onto trucks. Practical application: ensures smooth intermodal transfers. Challenge: coordination with multiple service providers and regulatory compliance.

Hazardous Materials (HAZMAT) – substances that pose risks to health, safety, or the environment and require special handling. Related terms: dangerous goods, compliance. Example: A warehouse stores flammable chemicals in a designated HAZMAT area. Practical application: mandates labeling, segregation, and training. Challenge: strict regulations and higher insurance premiums.

Inventory Accuracy – the degree to which recorded inventory quantities match the physical count. Related terms: cycle count, reconciliation. Example: An inventory accuracy of 98 % means two out of every hundred units are misrecorded. Practical application: informs trust in inventory data for planning. Challenge: discrepancies arise from mis-picks, data entry errors, or theft.

Inventory Carrying Cost – the total cost of holding inventory, including capital, storage, insurance, and obsolescence. Related terms: holding cost, total cost of ownership. Example: Carrying cost of 20 % per year on \$500,000 inventory equals \$100,000 annually. Practical application: influences reorder and safety stock decisions. Challenge: hidden costs such as opportunity cost are difficult to quantify.

Just-In-Time (JIT) – a strategy that seeks to receive goods only as they are needed in the production process, minimizing inventory. Related terms: lean manufacturing, pull system. Example: An automotive plant receives components minutes before assembly. Practical application: reduces waste and storage needs. Challenge: vulnerable to supply disruptions and requires reliable suppliers.

Kanban – a visual signaling system that triggers replenishment when inventory falls below a predetermined level. Related terms: pull system, visual management. Example: An empty bin card signals the need to reorder a specific part. Practical application: controls inventory flow without complex calculations. Challenge: requires disciplined use and accurate demand signals.

Kitting – the process of assembling individual items into a ready-to-ship kit or bundle. Related terms: pre-assembly, order consolidation. Example: A promotional kit includes a brochure, a sample product, and a coupon. Practical application: speeds downstream picking and enhances customer experience. Challenge: additional handling steps increase labor and potential errors.

Lead Time – the elapsed time from placing an order to receiving the goods. Related terms: order cycle time, replenishment lead time. Example: Supplier lead time of 14 days for a custom part. Practical application: determines safety stock levels. Challenge: variability in lead time creates forecasting uncertainty.

LIFO (Last-In, First-Out) – an inventory method where the most recently received items are issued first. Related terms: FIFO, inventory valuation. Example: A warehouse issues the newest batch of a non-perishable product first. Practical application: can be used for items where newer stock is preferable. Challenge: may not reflect actual physical flow and can be restricted by accounting standards.

Location Consolidation – the practice of reducing the number of storage locations by moving items to fewer, larger spaces. Related terms: bin reduction, space optimization. Example: Merging two adjacent aisles into a single high-bay area. Practical application: frees up floor space for additional throughput. Challenge:

may increase travel distance for pickers.

Lot Size – the quantity of units produced or ordered in a single batch. Related terms: EOQ, batch production. Example: Manufacturing a lot of 1,000 units before switching to a new product line. Practical application: balances setup costs with inventory holding costs. Challenge: large lot sizes can lead to excess inventory.

Material Handling Equipment (MHE) – tools and machines used to move, store, and protect goods within a warehouse. Related terms: forklift, conveyor. Example: A pallet jack lifts and transports pallets across the dock. Practical application: improves efficiency and reduces manual labor. Challenge: equipment maintenance and operator training.

Mezzanine Floor – an intermediate level built within a warehouse to increase storage capacity without expanding the building footprint. Related terms: vertical expansion, rack height. Example: Adding a mezzanine adds 5,000 sq ft of storage above the main floor. Practical application: maximizes cubic utilization. Challenge: structural load limits and fire safety compliance.

Minimum Order Quantity (MOQ) – the smallest quantity a supplier is willing to sell in a single order. Related terms: batch size, supplier contract. Example: A manufacturer sets an MOQ of 500 units for a custom component. Practical application: ensures production efficiency for the supplier. Challenge: may force the buyer to hold excess inventory.

Mirrored Inventory – a duplicate inventory record maintained in a separate system to provide redundancy or support integration. Related terms: master data, data synchronization. Example: ERP system and WMS both hold inventory balances for the same warehouse. Practical application: facilitates data exchange between platforms. Challenge: requires constant synchronization to avoid inconsistencies.

Mobile Racking – a storage system that uses movable racks or shelves to create flexible aisle configurations. Related terms: dynamic storage, aisle width. Example: Rolling racks are repositioned to open a temporary picking lane. Practical application: adapts to fluctuating space needs. Challenge: requires careful planning to avoid damage during movement.

Multimodal Transport – the use of two or more transportation modes (e.g., rail, road, sea) under a single contract. Related terms: intermodal, logistics network. Example: Goods travel by rail to a port, then by ship to the destination. Practical application: leverages strengths of each mode for cost and speed. Challenge: coordination of schedules and handling transfers.

Net Stock – the quantity of inventory available for sale after allocating safety stock, work-in-process, and reserved items. Related terms: available stock, on-hand inventory. Example: Net stock of 150 units after reserving 30 for pending orders. Practical application: informs order fulfillment decisions. Challenge: dynamic reservations require real-time updates.

Obsolete Inventory – stock that is no longer usable or marketable due to technological, regulatory, or demand changes. Related terms: dead stock, write-off. Example: A discontinued smartphone model that cannot be sold. Practical application: triggers disposal, donation, or liquidation processes. Challenge:

financial loss and storage cost penalties.

Order Cycle Time – the total time from order receipt to order delivery to the customer. Related terms: lead time, fulfillment time. Example: An order cycle time of 48 hours for an e-commerce order. Practical application: measures operational efficiency. Challenge: variability in picking, packing, and shipping can extend cycle time.

Order Picking – the process of retrieving items from storage locations to fulfill customer orders. Related terms: pick path, wave picking. Example: A picker uses a handheld device to locate and collect SKUs for a shipment. Practical application: directly impacts order accuracy and throughput. Challenge: travel distance and picker fatigue affect productivity.

Order Split – the division of a single customer order into multiple shipments due to inventory location, availability, or carrier constraints. Related terms: partial shipment, backorder. Example: A customer order is shipped in two parcels because one item is on backorder. Practical application: enables earlier delivery of available items. Challenge: increases handling and shipping costs.

Order-to-Cash (O2C) – the end-to-end business process that starts with order receipt and ends with cash receipt. Related terms: fulfillment, invoicing. Example: O2C includes order entry, picking, shipping, invoicing, and payment collection. Practical application: integrates sales, logistics, and finance functions. Challenge: misalignments can cause delays and cash flow issues.

Outbound Logistics – the activities involved in moving finished goods from a warehouse to the end customer or downstream distribution point. Related terms: distribution, shipping. Example: Loading trucks for regional retail stores is part of outbound logistics. Practical application: focuses on order fulfillment efficiency. Challenge: coordination with carriers and accurate delivery scheduling.

Overstock – inventory levels that exceed the forecasted demand, leading to excess holding costs. Related terms: excess inventory, inventory write-down. Example: A retailer holds 30% more of a seasonal product than needed. Practical application: prompts sales promotions or inventory liquidation. Challenge: ties up capital and may become obsolete.

Pick-to-Light – a technology that uses illuminated indicators at storage locations to guide pickers to the correct items. Related terms: voice picking, automated picking. Example: A light turns green at bin C-07, indicating the picker should retrieve two units. Practical application: speeds up picking and reduces errors. Challenge: installation cost and maintenance of light modules.

Pick-to-Order – a picking method where each picker retrieves items for a single order in one pass. Related terms: single-order picking, order fulfillment. Example: A picker collects all SKUs for Order 12345 before moving to the next order. Practical application: minimizes handling for high-value or customized orders. Challenge: may increase travel time when orders are small and scattered.

Pick-to-Slot – a method where pickers retrieve items for multiple orders from a predetermined slot before consolidating them. Related terms: batch picking, slotting. Example: A picker fills a tote with items from bin D-02 for ten different orders. Practical application: reduces travel distance for high-volume SKUs.

Challenge: requires careful order grouping to avoid mixing.

Pick-to-Cart – a hybrid picking process where a picker loads items onto a cart that serves as a mobile buffer before final order assembly. Related terms: cart picking, staged picking. Example: A picker fills a cart with items for five orders, then a second worker assembles the final packages. Practical application: balances speed and order accuracy. Challenge: cart capacity limits and coordination between workers.

Physical Inventory – a complete count of all items in a warehouse, typically performed annually or semi-annually. Related terms: stocktake, inventory audit. Example: A year-end physical inventory reconciles system balances with actual counts. Practical application: validates perpetual inventory records. Challenge: disruptive to operations and labor-intensive.

Pick-Path Optimization – the design of the most efficient route for a picker to travel through the warehouse. Related terms: route planning, travel distance. Example: Software calculates a path that visits the shortest sequence of bins for a given order. Practical application: reduces picker travel time and labor cost. Challenge: dynamic order volumes and changing layout can affect optimal paths.

Planned Order Release (POR) – a schedule that specifies when to release production or purchase orders to meet future demand. Related terms: MRP, demand planning. Example: MRP generates a POR for 5,000 units of a component to be released next month. Practical application: aligns supply with forecasted demand. Challenge: inaccurate forecasts can cause premature or delayed releases.

Post-Pick Inspection – a quality check performed after items are picked but before they are packed or shipped. Related terms: quality control, defect detection. Example: Inspecting fragile items for damage before packaging. Practical application: reduces returns and improves customer satisfaction. Challenge: adds a step that can slow throughput if not well integrated.

Pre-Allocation – the reservation of inventory for a specific customer or sales channel before the order is placed. Related terms: inventory reservation, demand commitment. Example: A key retailer receives a pre-allocation of 10% of a new product launch. Practical application: secures supply for strategic partners. Challenge: may lead to excess inventory if demand forecasts change.

Pre-Picking – the practice of gathering items in advance of order receipt, based on anticipated demand. Related terms: staging, pre-assembly. Example: Seasonal high-turnover items are pre-picked into totes before the holiday rush. Practical application: speeds up order fulfillment during peak periods. Challenge: risk of picking items that may not be ordered, leading to waste.

Prime Cost – the sum of direct material and direct labor costs, often used to assess product profitability. Related terms: contribution margin, cost of goods sold. Example: Prime cost of a manufactured widget is \$12 (materials \$8 + labor \$4). Practical application: helps pricing and margin analysis. Challenge: indirect costs are excluded, which may distort true profitability.

Process Flow Diagram (PFD) – a graphical representation of the steps involved in a logistics or warehouse process. Related terms: workflow, SOP. Example: A PFD shows the sequence from receiving to put-away, picking, and shipping. Practical application: identifies bottlenecks and standardizes procedures. Challenge:

keeping the diagram updated with process changes.

Pull System – a production control method where downstream demand signals trigger upstream replenishment. Related terms: Kanban, demand-driven. Example: A retailer's POS data triggers a replenishment order to the supplier. Practical application: reduces excess inventory and improves responsiveness. Challenge: requires reliable real-time data and flexible suppliers.

Push System – a production approach where forecasts drive production and inventory levels, independent of actual demand. Related terms: forecast-driven, MRP. Example: A manufacturer produces based on a quarterly sales forecast. Practical application: enables economies of scale. Challenge: can lead to overproduction and high inventory carrying costs.

Quality Assurance (QA) – systematic activities designed to ensure that products meet specified standards. Related terms: QC, inspection. Example: Random sampling of incoming pallets verifies compliance with specifications. Practical application: maintains brand reputation and reduces returns. Challenge: balancing inspection depth with throughput.

Quantity On Hand (QOH) – the total number of units physically present in inventory at a given moment. Related terms: on-hand inventory, stock level. Example: QOH of 2,500 units for SKU98765. Practical application: forms the basis for reorder calculations. Challenge: discrepancies arise from unrecorded movements or theft.

Rack Density – the amount of storage space utilized per unit of floor area, often expressed as pallets per square foot. Related terms: space utilization, cubic utilization. Example: A high-density rack system achieves 0.8 pallets per sq ft. Practical application: maximizes storage capacity. Challenge: higher density may increase picking travel distance.

Receiving Dock – the area where inbound shipments are unloaded, inspected, and recorded. Related terms: inbound dock, staging area. Example: The receiving dock is equipped with dock levelers and pallet jacks. Practical application: serves as the first point of entry for inventory. Challenge: congestion during peak inbound periods.

Reorder Point (ROP) – the inventory level that triggers a new order to replenish stock. Related terms: safety stock, lead time demand. Example: $ROP = 150$ units when average demand is 30 units per day and lead time is 5 days. Practical application: prevents stockouts. Challenge: inaccurate demand forecasts can set ROP too high or too low.

Replenishment – the process of moving inventory from reserve or upstream locations to active picking zones. Related terms: restocking, pull replenishment. Example: Automated conveyors move replenishment cases to the front of the aisle. Practical application: keeps high-velocity items readily available. Challenge: timing must align with consumption rates to avoid excess.

Return Merchandise Authorization (RMA) – a formal approval process for customers to return defective or unwanted products. Related terms: reverse logistics, warranty claim. Example: A customer receives an RMA number to ship back a faulty appliance. Practical application: standardizes return handling and tracking.

Challenge: processing returns adds labor and may affect inventory accuracy.

Reverse Logistics – the flow of goods from the customer back to the manufacturer or distributor for return, repair, refurbishment, or disposal. Related terms: returns processing, closed-loop supply chain. Example: Collecting used electronics for refurbishment. Practical application: recovers value and reduces waste. Challenge: managing return volume and disposition decisions.

RFID (Radio-Frequency Identification) – a technology that uses electromagnetic fields to automatically identify and track tags attached to objects. Related terms: barcoding, IoT. Example: RFID readers scan pallets as they move through a dock door, updating inventory in real time. Practical application: enhances visibility and reduces manual scanning. Challenge: tag cost and interference in metal-rich environments.

Safety Stock – extra inventory held to protect against demand variability and supply delays. Related terms: buffer stock, service level. Example: Keeping 20 % additional units of a high-risk SKU. Practical application: improves order fill rate. Challenge: excess safety stock increases carrying costs.

Seasonal Inventory – stock that is required to meet demand fluctuations tied to specific seasons or events. Related terms: demand planning, promotional stock. Example: Increased inventory of swimwear in summer months. Practical application: aligns supply with predictable demand peaks. Challenge: accurate seasonal forecasts are essential to avoid overstock.

Shelf Life – the period during which a product remains usable, saleable, or compliant with quality standards. Related terms: expiration date, first-expire-first-out (FEFO). Example: A dairy product with a 30-day shelf life must be sold before the expiration date. Practical application: dictates inventory rotation method. Challenge: monitoring and managing perishable goods.

Slotting Optimization – the process of assigning SKUs to storage locations based on demand velocity, size, and picking frequency. Related terms: warehouse layout, ABC analysis. Example: Fast-moving items placed in the front aisle for easy access. Practical application: reduces travel distance and improves picker productivity. Challenge: frequent changes in demand require periodic re-slotting.

Standard Operating Procedure (SOP) – documented instructions that outline how to perform specific tasks consistently. Related terms: process documentation, work instruction. Example: SOP for receiving includes steps for unloading, inspection, and data entry. Practical application: ensures compliance and training consistency. Challenge: keeping SOPs up-to-date with process changes.

Stock Keeping Unit (SKU) – a unique identifier for each distinct product, variation, or item in inventory. Related terms: item code, product identifier. Example: SKU ABC-123 refers to a red, size-M T-shirt. Practical application: enables precise tracking and reporting. Challenge: managing a large SKU base can increase complexity.

Stock Rotation – the practice of moving older inventory to the front of picking locations to ensure it is sold first. Related terms: FIFO, FEFO. Example: Rotating pallets of canned goods so that older expiration dates are accessed first. Practical application: minimizes waste and obsolescence. Challenge: requires disciplined picking and accurate location data.

Staging Area – a temporary space where items are gathered before picking, packing, or shipping. Related terms: buffer zone, cross-dock. Example: A staging area holds 100 cartons ready for outbound loading. Practical application: smooths workflow and separates inbound from outbound processes. Challenge: limited space may cause congestion.

Supply Chain Visibility – the ability to track and monitor inventory, shipments, and processes across the entire supply chain in real time. Related terms: data transparency, IoT. Example: A dashboard shows the location of every pallet from supplier to retailer. Practical application: enables proactive decision-making. Challenge: integrating disparate data sources and ensuring data accuracy.

Supply Chain Management (SCM) – the coordination of all activities involved in sourcing, production, and distribution of goods. Related terms: logistics, procurement. Example: SCM integrates supplier contracts, warehouse operations, and transportation planning. Practical application: optimizes cost, service, and speed. Challenge: complexity increases with global networks and multiple stakeholders.

Sustainable Logistics – logistics practices that aim to reduce environmental impact, such as emissions, waste, and energy consumption. Related terms: green supply chain, carbon footprint. Example: Using electric forklifts and optimizing routes to lower fuel usage. Practical application: enhances corporate responsibility and may reduce costs. Challenge: initial investment and measurement of sustainability metrics.

System Integration – the process of linking warehouse management systems (WMS) with other enterprise applications like ERP and transportation management systems (TMS). Related terms: API, data exchange. Example: Real-time inventory updates flow from WMS to ERP for accurate financial reporting. Practical application: eliminates data silos and improves decision-making. Challenge: compatibility issues and change management.

Third-Party Logistics (3PL) – outsourcing of logistics functions, such as warehousing, transportation, and distribution, to an external provider. Related terms: 4PL, logistics provider. Example: A retailer contracts a 3PL to manage its regional distribution center. Practical application: leverages specialized expertise and scalability. Challenge: loss of direct control and dependence on provider performance.

Throughput – the amount of material or number of orders processed by a warehouse within a given time period. Related terms: capacity, productivity. Example: A facility achieves a throughput of 1,200 pallets per day. Practical application: measures operational efficiency. Challenge: bottlenecks in receiving or picking can limit throughput.

Time-Based Slotting – assigning storage locations based on the time of day or shift when items are most frequently picked. Related terms: dynamic slotting, demand pattern. Example: Morning-peak SKUs are placed near the front for daytime pickers. Practical application: aligns storage with pick schedules. Challenge: requires continuous monitoring of demand cycles.

Transportation Management System (TMS) – software that plans, executes, and optimizes the movement of goods. Related terms: carrier selection, freight audit. Example: TMS selects the lowest-cost carrier for a shipment based on weight and destination. Practical application: reduces freight costs and improves

visibility. Challenge: integration with WMS and data accuracy.

Turnover Ratio – a metric that measures how many times inventory is sold or used over
